

CLOVERS

Kyambro Persian Clover

Thrives in high pH soils

Trifolium resupinatum

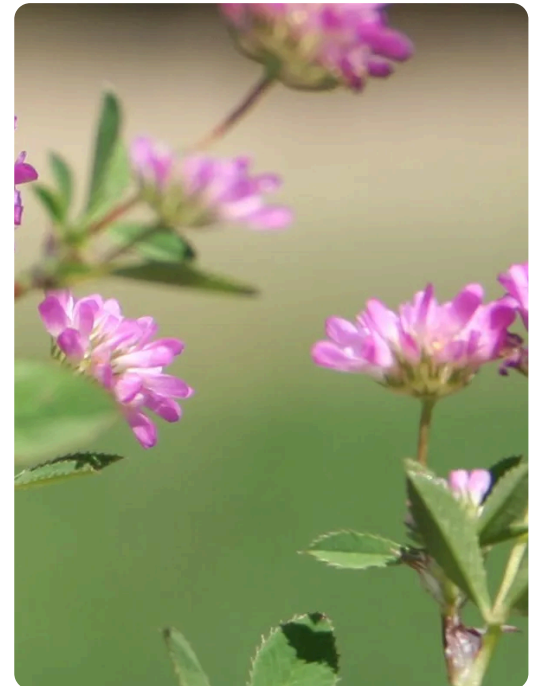

Mid season flowering hard seeded Persian. Very persistent if allowed to reseed in first year. Handles wet conditions, has high quality forage and makes higher quality hay than Balansa. Suited to permanent pasture systems. Will tolerate limited salinity.

ABOUT THIS VARIETY

Kyambro Persian Clover is a self-regenerating annual legume which can produce excellent forage and hay. Regrowth after grazing is excellent, and it has as high a nutritive value as pasture or hay.

Kyambro is a prostrate to semi upright winter annual: through winter the plants form a low rosette, and in spring the stems develop rapidly. It can be grown on a wide range of soil types.

Kyambro produces very high-quality forage, and earlier trials conducted in Victoria showed crude protein levels equal to lucerne. The growth rate of weaner sheep fed on Kyambro hay was 160 grams/day, compared to pasture hay at 50 grams/day and lucerne at 90 grams/day. Kyambro generally has higher dry matter digestibility than other legumes.

QUICK FACTS

-  **TYPE & PERSISTENCY**
Annual
-  **MIN RAINFALL**
500 mm+
-  **SOIL & PH**
Soil range: Sand to Heavy · pH 4.5+ (CaCl₂)
-  **SOWING RATE**
3–6 kg/ha General, 2–3 kg/ha In a mix
-  **TOLERANCES**
Waterlogging, Mild Salinity
-  **END USE**
Grazing, Hay
-  **DAYS TO FLOWERING**
120
-  **HARD SEED LEVEL**
High

KEY ATTRIBUTES

- ✓ Mid season flowering, hard seeded Persian
- ✓ High quality forage, and higher quality hay than balansa
- ✓ Handles wet conditions
- ✓ Very persistent if allowed to reseed in year one
- ✓ Excellent regrowth after grazing
- ✓ Suited to permanent pasture systems

PLANTING & GRAZING NOTES

Well suited to rotational grazing systems sown with other annual legumes and ryegrass. Allow it to reseed in the first year for persistence. Inoculate with group C inoculant before sowing.

STAND LIFE

Hard seeded and very persistent if allowed to reseed in the first year. Suited to permanent pasture systems.
