MIXES

SouWest Pasture Mix

The perfect mix, combining productivity with diversity

Adaptable and diverse mix across a wide range of soil types. A blend of annual and perennial ryegrasses, black and white seeded sub clovers, and Balansa, Persian, Crimson and Arrowleaf clovers. Ideal mix for dryland sowing. Can be managed for seed set, providing pasture over subsequent years. A good option for farmers pursuing regenerative agriculture practices, with its diversity in the mix. Suited to grazing, silage or hay.

ABOUT THIS VARIETY

SouWest Pasture Mix is the original and WA's best known and grown mix, proven year-in, year-out. It is ideally suited for farmers looking for a specialty blend of ryegrass and clover that will provide a balanced pasture during the growing season.

SouWest contains proven varieties that have been selected and developed to perform in our unique Western Australian environment. It is suited to a wide range of farming systems, soil types and conditions, and where managed appropriately should also continue to provide high quality pasture into the following years.

Arrowleaf, Balansa, Crimson and Persian clovers provide a continuity of early and late feed, and the shorter season Dargo complements Abundant for earlier productivity.

QUICK FACTS

MIN RAINFALL
500 mm+

SOIL & PH
Soil range: Sand to Heavy · pH 5+ ($CaCl_2$)

SOWING RATE
15–25 kg/ha General

KEY ATTRIBUTES

- ✓ The original and WA's best known and grown mix
- ✓ Ideal mix for dryland sowing
- ✓ Diversity suits regenerative agriculture practices
- ✓ Annual and perennial ryegrasses with sub and aerial clovers
- ✓ Balanced pasture through the growing season
- ✓ Can regenerate into the following years

MIX COMPONENTS

Formulation 2026

COMPONENT
Dunstan Perennial Ryegrass A mid-maturing, deep rooted diploid perennial ryegrass with strong rust resistance and persistence, making it a suitable option for medium rainfall zones. Produces high quality feed during winter and spring and gives the pasture a good chance of finishing strong in a variable season.
Abundant Tetraploid Annual Ryegrass High quality, high yielding and long growing season. Excellent vigour with high stress and disease tolerance.
Dargo Diploid Annual Ryegrass The diploid addition provides greater adaptability with high winter and early spring production, and being a shorter season variety complements the Abundant for earlier productivity.
Black & White Seeded Subterranean Clovers Black and white seeded subterranean clovers will produce across a wide range of soils and farming systems.
Aerial Seeded Clovers Arrowleaf, Balansa, Crimson and Persian clovers provide a continuity of early and late feed.

PLANTING & GRAZING NOTES

Optimal sowing time is autumn to winter. Cultivate or spray out any existing pasture or persistent weeds immediately before planting, and prepare an optimal seed bed, applying lime or gypsum if required. Ensure you have adequate soil moisture with the possibility of follow up rain; if dry seeding for early production, make sure paddocks are clean of weeds and you have assessed the risk of a false break. Plant as shallow as possible with good seed to soil contact. Increased sowing rates and fertiliser will encourage interplant competition during establishment, offering earlier grazing and higher dry matter production. Once established, ensure plants are not prone to pulling, then graze to 8–10cm high to increase tiller density. Do not over graze. Apply a rotational grazing program through winter and spring, and cut mid spring for silage or late spring for hay.

DISEASE & PEST RESISTANCE

Dunstan Perennial Ryegrass has strong rust resistance.

STAND LIFE

Lock up and graze through winter and early spring, then allow the paddock to run to seed in spring in the first year. This provides the following years' regeneration, and if managed well and locked up annually to seed, SouWest should continue to provide high quality pasture into subsequent years.

CARBON FARMING & PASTURE DIVERSITY

Carbon farming offers farmers the opportunity to improve soil health, build soil carbon and support more sustainable farming systems. Many of IH Seeds pasture mixes feature a diverse range of grasses, legumes and herbs that can support productive pastures, encourage deeper root growth, and contribute to soil carbon sequestration. Diverse pastures may help farmers meet the requirements of eligible carbon farming projects under Australia's Emissions Reduction Fund (ERF), with the potential to earn Australian Carbon Credit Units (ACCUs) where approved methods and eligibility criteria are met.
