

FESCUES & OTHER GRASSES

Treposno Cocksfoot

Persistent, high yielding, cold and drought tolerant

Dactylis glomerata

An improved variety selected for increased yields and cold tolerance. Suited to acid soils with excellent summer, autumn and spring production. Hardy perennial grass with dense swards. Ideally suited to permanent pasture, silage or hay. Good value for money being a small seed.

ABOUT THIS VARIETY

Treposno belongs to the early to mid-season maturity range. The main features of this variety are an upright habit, with high mass formation after sowing. Treposno is highly valued for its yield potential, particularly in the first cut and the overall yield. Moreover, the variety is characterised by good winter-hardiness and sward density.

Cocksfoot is considered ideal for dry places and is resistant to cold. It can tolerate an intensive fertilisation level and cropping, as well as grazing.

QUICK FACTS

-  **TYPE & PERSISTENCY**
Perennial
-  **MIN RAINFALL**
450 mm+
-  **SOWING RATE**
5–8 kg/ha General
-  **TOLERANCES**
Low pH
-  **END USE**
Grazing, Hay, Silage, Permanent pasture
-  **PLOIDY**
Diploid
-  **HEADING DATE**
Early
-  **GROWTH SEASON**
Summer-active

KEY ATTRIBUTES

- ✓ Improved variety selected for yield and cold tolerance
- ✓ Hardy perennial forming dense swards
- ✓ Good value for money, being a small seed
- ✓ Excellent summer, autumn and spring production
- ✓ Upright habit with high yield potential
- ✓ Suited to permanent pasture, silage or hay

PLANTING & GRAZING NOTES

The variety can be used for 4-6 grazings and be mowed 3-4 times.

STAND LIFE

Persistent, hardy perennial grass with dense swards.
